Understanding Your Aptitudes

People seek us out because of a desire to know more about themselves and to find meaningful work that reflects who they are. Our aptitude tests predict potential; there is no one way to use the information, and no good or bad scores. Every aptitude pattern is right for the person who possesses it, because it's simply who they are. You can use this knowledge of your natural pattern of aptitudes in many ways. You can use it to make informed decisions about your career and educational path. Within a job, it can help you decide where to take the reins and where you might want to delegate tasks. This knowledge can also help you understand yourself and your experiences (both positive and negative), and help others better understand you. This report is a snapshot of how your mind likes to work.

What are aptitudes?

Aptitudes are natural talents, or special abilities, for doing or learning to do certain kinds of tasks. They are not a result of knowledge, interest, or training, but instead are traits you're born with, like height or eye color. Our research has shown that people are more satisfied when their work lets them challenge their high scores and avoid focusing on their low scores. We've also found that aptitudes are stable over the long term, so you can use this information to make decisions today and throughout your lifetime.

Understanding Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

What do my scores mean?

Our tests are scored on a percentile basis, which means we're looking to see how you perform on our tests relative to other people in your age group who have tested with us. For example, a score of 80th percentile indicates that you scored as high as or higher than 80 out of a 100 people your age who took that test. We have low, average, and high scores on our tests and a scale ranging from 5th - 99th percentile. (There's no 100th percentile on our tests, because that would mean you scored higher than yourself). If you scored in the high range on one of our tests, we have a high degree of confidence that you have a natural ability, or natural advantage, in that area and that you will be more satisfied and successful if you have an outlet for it in your work. An average score indicates that that task is as easy for you as for many people; you can do it, but it likely doesn't call out to you to be used. A low score indicates that you might have found that test to be difficult or tedious, requiring more effort to complete. In some cases you might want to avoid areas where you have low scores, but low scores can also mean that your approach is simply different from someone with a high score. A low score can be an advantage in certain fields or situations.

Why did you test my vocabulary?

Think about how often we use words to present ourselves and our ideas to others, through resumes, interviews, or even just everyday conversations at a party or in school. Words are tools of thought. The more words you know, the more flexible a communicator you will be. You will be able to talk to anyone and feel confident that you know

Understanding Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

what's being said to you and that you have the ability to explain your ideas accurately and efficiently. If you're not happy with your vocabulary score, improve it! Vocabulary can partially be the result of opportunities we've had, but it's also a measure of the effort we put into it. Look for the vocabulary discussion at the end of your report for ways to expand your word knowledge.

Research

As a research organization, we are constantly working to improve our tests, to explore new aptitudes and ways to measure them, and to validate our results against occupational groups. We also reach out to past clients and do survey research to learn how people have used their aptitudes to make life decisions, and how aptitudes relate to their profession. Your contribution is greatly appreciated.

Your Core Pattern

Antoine Savelli

330259-12

March 26, 2026

Inductive Reasoning and Analytical Reasoning

You are a natural problem solver with a flair for thinking logistically. Consider fields that allow you to analyze and solve problems.

CAREER FIELDS TO CONSIDER

- Business consulting
- Marketing strategy
- Logistics
- Strategic planning
- Event planning
- Law
- Policy analysis
- Intelligence analysis
- Clinical psychology
- Counseling
- Sociology
- Emergency management
- Investigative work
- Editing
- User experience design
- Politics
- Public health planning
- Teaching, coaching, training
- Criminology
- Instructional design
- Sustainable development

Your Core Pattern

Here are some suggestions for careers you might wish to investigate that would capitalize on your other aptitudes:

EMPHASIS:
Sound

- Music promotion
- Music journalism
- Radio, podcast production
- Speech therapy
- Sound technology
- Foley arts
- Speechwriting
- Sound editing
- Music performance
- Music composition
- Talent scout
- Songwriting
- Podcasting
- Broadcasting
- Vocal Coaching

EMPHASIS:
Numbers

- Financial planning
- Investment analysis
- Market research
- Behavioral economics
- Economics
- Fraud investigation
- Public health planning
- Data analytics
- Operations research analysis

Your Core Pattern

Antoine Savelli

330259-12

March 26, 2026

EMPHASIS:
Grip Strength

- Coaching, teaching sports
- Outdoor education
- Property management
- Law enforcement
- Firefighting
- Armed forces
- Paramedics
- Culinary arts
- Film location work

EMPHASIS:
Foresight

- Marketing, advertising
- Business development
- Writing
- Lobbying, advocacy
- Program development
- Educational consulting
- Forecasting

Discussion of Your Aptitudes

Inductive Reasoning

The Inductive Reasoning aptitude is an ability to quickly find connections among different types of information. If you score high in this area, your mind might be constantly evaluating information to draw a conclusion. This synthesizing approach can be an especially good fit for work that lets you diagnose or troubleshoot; or in areas with puzzles or problems to solve like consulting, law, strategy, executive work, or forensics. You might find that you are naturally curious about the world around you or have an interest in how people or organizations work. That could be an advantage in areas concerned with human behavior like investigative journalism, psychology, marketing, sociology, or behavioral economics. Many people with this aptitude enjoy roles that let them make assessments or choose the best solution from a series of options like buyers, hiring managers, and judges do on a daily basis.

Instinctive decision-making is a basic characteristic of many people with this aptitude, and they often enjoy work that moves at a fast pace and requires rapid choices. Many people with this aptitude seem to enjoy time pressure and typically handle tight deadlines well—even to the point of procrastination. This type of thinking can almost feel like a “gut” response and can be difficult to turn off. Look for innovative fields that offer you variety and a chance to problem solve.

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

Analytical Reasoning

Your score on our Analytical Reasoning test indicates that you might be a natural planner who prioritizes efficiency. This aptitude measures your ability to quickly select and order relevant information and to arrange ideas in a logical sequence. You can also think of it as a more systems-based or methodical approach to problem-solving, or as the instinct to organize and classify. You might especially enjoy roles that let you create systems; understand or streamline processes; or apply structure to data, events, or people. Analytical Reasoning is also highly correlated with grades in a wide variety of school courses, including economics, natural sciences, and mathematics, and also seems to be a measure of general or logical reasoning.

It's difficult to think of a career where you wouldn't find yourself using this ability, but you can make it your emphasis by looking for fields that hinge on logical processes. You could find outlets for it in law, accounting, project management, library science, archival work, User Experience Design, event planning or logistics. Communication needs logic to effectively get ideas across, so you could also look for roles that involve explaining facts or guiding a reader through a process, like in technical or grant writing, linguistics, or curriculum design. Look for opportunities to analyze, order, or create systems and structure.

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

Graphoria

Graphoria is one of the most wide-ranging and useful abilities we measure. It can be thought of as perceptual, clerical, or eye-scanning speed. You might find that you can quickly and accurately scan over figures on a page, which plays a crucial role in clerical work and in processing data and information. This is a key aptitude in roles that involve working with numbers, like in accounting, finance, and economics, to the point that this ability was previously called the “accounting aptitude.” Fields like human resources, law, education, copy editing and social work also have many opportunities for people who can manage large quantities of detailed information. Administration roles in management, education, the arts, nonprofits, or government are also sure bets for using this versatile aptitude. Project Management in any field requires quick clerical speed, especially when working with budgets and keeping track of schedules and tasks. Our research also shows that this aptitude is helpful for librarians and archivists.

Graphoria can play a significant role in formal education where grades are determined by timed, written tests. Students who have this aptitude might find that note-taking, nightly written homework, and standardized tests are relatively manageable for them; or they may be naturally quick readers who can follow subtitles on a movie screen or learn to read sheet music. Your ability to quickly handle paperwork will be especially valued in roles where you track and manage data and information.

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

Grip Strength

The Grip test uses a device called a dynamometer to measure your hand strength. Our research has shown that people with high Grip scores often find satisfaction in using their physical strength or restless energy in their work or hobbies. Maybe you've always known that you could never be satisfied working in a cubicle: Consider outdoor careers like forestry, botany, environmental science, agriculture, or surveying. You may have a higher level of energy than most people and enjoy adrenaline-based tasks. Jobs in athletics, the military, firefighting, law enforcement, or construction generally demand more strength and stamina than desk jobs.

You might also look for careers that allow you to travel (flight attendants or transportation managers, for example) or do location and on-site work in film, events, tourism, or hospitality. Think about jobs that involve meeting clients in their homes or offices, or working "in the field" as an inspector or appraiser in real estate or insurance. Occupations in sales, teaching, or healthcare can provide more of a balance between mobile and sedentary tasks. If you've thought about becoming a therapist of some type, look for specializations that are more active like recreational therapy, wellness coaching, and occupational therapy.

Silograms

Our Silograms test measures a gift for word learning. This ability can

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

be helpful in almost any career, since nearly every industry has its own specialized terminology. New words stick in your mind on their own, and you might find it especially rewarding to focus on areas that require a deep knowledge and understanding of language. Writers, editors, and lawyers tend to have high scores on this test. Branches of science like botany or biology are vocabulary-heavy and could be easier to learn for someone with a strong verbal memory. If you enjoy the more technical aspects of languages, linguistics or lexicography could also be natural choices.

This aptitude correlates with college majors in a foreign language. Consider forming a career around a foreign language of your choice — translating, interpreting, foreign language teaching, or working with ESL learners. You might choose to work overseas in fields like foreign affairs or diplomacy, anthropology, international business, or international development. If you have an interest in travel, you could find a career in ecotourism, with an international airline, or with cultural exchange programs. You'll also find an ability to speak a second language to be useful in helping fields like healthcare, social work, and nonprofits. Look for careers where words are front and center or where international opportunities are available.

Pitch Discrimination

Pitch Discrimination is an ability to distinguish between fine differences in tones. This aptitude may be particularly helpful for

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

learning instruments in which you control the pitch, like playing the clarinet, violin, guitar, and even in singing. Auditory aptitudes are strongly associated with music-oriented careers like music composition, musicology, or playing professionally. Even if you're not a musician yourself, you might consider roles on the business side of the music industry like tour or venue management, promotions, sales, or marketing.

Pitch Discrimination can also be thought of as a sound-related aptitude, so you might find good outlets for it in fields that relate to speaking or hearing, like speech pathology, vocal coaching, or broadcast journalism. Researchers have found correlations between music abilities and foreign language skills, as well: Consider learning a tonal language like Mandarin Chinese or Vietnamese and pursuing international work like diplomacy, international development, foreign language teaching, or anthropology.

Color Discrimination

The Color Discrimination test evaluates your ability to distinguish between subtle differences in color. This aptitude plays a role in artistic fields like photography, graphic design, jewelry design, painting, illustration, and set design. You could also find applications for it by working as a make-up artist, tattoo artist, hair colorist, interior designer, or film colorist.

Not every client who has this talent is interested in becoming a

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

visual artist themselves, but there are many ways to work with color without taking an art class. Color is a language that's used to communicate, categorize, and invent meaning. Consider developing your knowledge of color psychology to work in branding, trend forecasting, or marketing. An eye for color would be an asset for a personal shopper, buyer, merchandiser, or stylist. Event planning, home staging, hospitality management, or garden design could also give you chances to use this aptitude. If your interests lie in academia, consider researching color themes in fields like art history, anthropology, archival work, or film studies. If you're interested in learning a trade, think about quality control work in manufacturing or printing facilities or career paths in telecommunications equipment installation. Look for color-critical roles in whichever field you pursue.

Number Facility

Number Facility measures an ease and quickness with calculating numbers. Unsurprisingly, a quick mental calculator plays a primary role in fields that involve number-crunching or working with numerical information. You can look for opportunities to use this ability in business. Accountants, treasurers and controllers working in all types of industries use this ability to coordinate and direct financial planning and budgeting. Auditors evaluate numerical information to ensure that a business is compliant with laws and standards. Bankers and salespeople also use this ability to quickly calculate prices or interest rates. If your interests lie in helping professions, you might use this ability to teach elementary or middle

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

school math. You could start a bookkeeping business that helps other small businesses handle their finances or become a personal finance coach. Even nurses who work in areas like critical care find themselves calculating how much medicine to administer to patients. You might be the person in your group who calculates the tip at a restaurant or the one who can figure out a currency exchange on a vacation abroad. Number facility can be thought of as a practical, day-to-day math aptitude.

Tonal Memory

Tonal Memory measures an ability to remember a sequence of notes. Of all the auditory aptitudes, it is the most correlated with success playing an instrument and might be particularly helpful for learning instruments that play melodies like the piano or flute. This aptitude is strongly associated with careers involving music. Professional musicians, music composers, and musicologists tend to have high scores in this area, but there are many ways to use these abilities without being a performing musician yourself. Consider roles on the business side of the music industry like tour or venue management, promotions, licensing, entertainment law, or marketing. Your ability to recall music would be especially helpful for a music scout, booking agent, or music supervisor. In education, you could run a school music program or work in a therapeutic role as a music therapist. Even if your work is unrelated to music itself, looking for positions at organizations with a music or performing arts focus

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

might make your job especially rewarding.

Many researchers have found correlations between music abilities and foreign language skills: Consider international work or areas in which being bilingual is an advantage, like diplomacy, international development, foreign language teaching, or anthropology. In a recent study of our auditory aptitudes, we found that writers as a group tend to score high in Tonal Memory, so try writing and delivering speeches or working in broadcasting or with podcasts.

Foresight

Foresight is the ability to see possibilities in the future. The high Foresight scorer seems to need long-term goals to work towards. Without future aspirations in mind, you might feel as though you lack direction or purpose. You may often wish for a larger goal to inform your decision-making, and it can be difficult to feel motivated when one goal has been accomplished and the next hasn't been set. Many people with this aptitude seem to be able to suffer now for something they want down the road and see ways around obstacles, which might explain why high Foresight is correlated with years of education attained and even entrepreneurial pursuits.

You can best use this aptitude by setting goals for yourself. Direct your thoughts and ideas about your future into long-term or wide-

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

ranging goals—goals that aren't necessarily completed in a matter of weeks or even months but are more about the goal itself than the specific completion date. This long-term vision ultimately comes from you, so think about the desires, experiences, and common themes that you have returned to in your life. It may be helpful to then work backwards from the end goal, gathering information on what education or experience would be needed in order to achieve the vision you formed. If your possibilities are like roads on a map, deciding on a destination first will make it easier to plan your journey and give you the confidence to commit to a path.

Structural Visualization

Structural Visualization is an ability to visualize three-dimensional objects in your mind's eye. Your score is a composite of two spatial tests that you took. Engineers, scientists, and mechanics tend to have natural talents in this area. Many people with this aptitude enjoy working with their hands and solving technical problems.

You scored in the average range for this ability, which indicates that visualizing three dimensions is as easy for you as for many people. We generally associate average scores in this area with a non-spatial approach — working with ideas, people, theories, or words, rather than with technical things. Roles in business, education, or law are good examples of fields that use abstract thinking. If you have average spatial abilities but a strong interest in spatial subjects, it can be helpful to think of some career paths, like science or

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

anthropology, as existing on a continuum in terms of their demand for 3D thinking. A spatial anthropologist might focus on physical anthropology or archeology, whereas a non-spatial anthropologist might be more interested in studying societies and cultures. In the sciences, biologists and environmental scientists tend to score lower on our spatial thinking tests than chemists and physicists do. Allied health fields like genetic counseling or nutrition might be better fits for an average score in this area than becoming a medical doctor. Keep in mind that many spatial industries have a need for non-spatial thinkers in roles like management, business development, marketing, writing, teaching, or sales.

Intermediate Personality

If your aptitudes point you in a direction, your score on our workplace personality test, or Word Association test, can indicate how you might want to use your abilities and interests. You scored in the Intermediate range on our personality test which places you between the specialized, individual Subjective approach and the collaborative, generalist Objective approach. Many clients who score like you feel they truly are in the middle and identify with aspects of both approaches. For some that could mean a balance between solo projects and group work. A marketing team, for example, might be made up of copywriters, art directors, and designers who bring their individual contributions to the overall project.

For many Intermediate scorers, however, specializing—especially

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

early in their careers—leaves more doors open down the road. An engineer can expand on their core skill set to go into engineering sales, but a salesperson might have a more difficult time becoming an engineer. Certain aspects of the individual approach might also resonate with you, especially a preference for your own projects and a desire to find work that you feel personally connected to. Pay attention to your interests, values, and passions when choosing a career direction. Consider deep diving into a field you feel strongly about but be sure to share your individual projects with an audience. Think of your approach as providing some flexibility in terms of which direction you take. You might have the strong work ethic and passion of the Subjective scorer but have an easier time working as part of a team when required.

Ideaphoria

Ideaphoria measures the rate of your flow of ideas. A high Ideaphoria score indicates a rapid flow of ideas, and is useful in careers that require brainstorming, communicating, persuading, informing, or educating. A low or average score may be helpful in fields in which focus and follow-through are more important.

Numerical Reasoning

Numerical Reasoning measures the ability to analyze and find patterns in numbers. Economists analyzing trends, financial planners providing investment guidance to individuals and businesses, and statisticians predicting trends or influencing policy can all use this ability.

Number Memory

A high score on our Number Memory test indicates that you have a natural

Discussion of Your Aptitudes

ability to remember numbers. It can be helpful for remembering account or ID numbers, dates, addresses, or appointment times.

Rhythm Memory

Rhythm Memory is an ability to recall rhythmic patterns. This can be helpful for learning and playing percussion instruments such as drums or the piano, but it may also be used in physical activities that require rhythm, such as dancing, swimming, or tennis.

Artistic Judgment

The Visual Designs test measures your preference for particular kinds of visual compositions. The first score, Visual Designs I, indicates whether you preferred clean and simple, or full and complex designs. Visual Designs II measures a preference for designs that are asymmetric and off-center versus those that are uniform and balanced. In a validation study, we found that artists had a distinct preference on these scales. Low or average scores in this area indicate a preference that is different from that of the artists we studied. History is full of artists and designers who saw things differently from their predecessors. If you have an interest in art or design, make your unique style your calling card.

Memory for Design

The Memory for Design test measures an ability to remember designs and abstract line drawings like charts, graphs, timelines, or pictures. It can be an asset in fields such as art history or graphic design, as well as in scientific and technical fields that frequently present information visually.

Observation

The Observation aptitude is the ability to spot and remember visual details, helpful in careers like quality control, law enforcement, and some art-related fields.

Discussion of Your Aptitudes

Antoine Savelli

330259-12

March 26, 2026

Dexterity

Tweezer Dexterity measures an ability to manipulate small tools, while Finger Dexterity measures an ability to complete detailed work at the tips of your fingers. Occupations in the culinary or healthcare worlds, for example, often require quick, dexterous work.

Vocabulary

Antoine Savelli

330259-12

March 26, 2026

“

Why do large vocabularies characterize executives and possibly outstanding men and women in other fields? The final answer seems to be that words are the instruments by means of which men and women grasp the thoughts of others and with which they do much of their own thinking. They are the tools of thought.

— JOHNSON O'CONNOR

Aptitudes and vocabulary are different: aptitudes are natural abilities, innate potentials we are all born with in some combination. Once matured, your pattern of aptitudes does not tend to change over time. On the other hand, vocabulary is something that is learned, and so can be changed. We are interested in vocabulary because, when we look at professions, we find that people who are at higher levels in their fields tend to have stronger vocabularies. Confident, fluent communicators seem to be curious about the world around them. That curiosity ideally translates into active, continual development of both general knowledge and command of the language.

Because vocabulary is learned, rather than innate, anyone can work actively to improve their knowledge of words. Johnson O'Connor identified three laws of vocabulary learning: First, we can arrange words in terms of relative difficulty. Easy words are frequent and familiar; they come up so often that everyone learns them early on. More difficult words are more rare; fewer people come across them and master them.

Second, we are all at some level on that scale between easy and difficult words (more familiar and less familiar words). We know almost all the words in our language up to a point where our knowledge becomes doubtful. O'Connor called this point your 'frontier of knowledge'. Beyond that point, we may recognize words, but do not have full mastery of them.

Vocabulary

Antoine Savelli

330259-12

March 26, 2026

O'Connor's third law is that the words you should focus on learning are not those that you have never seen. Instead, you should work to master the words that you recognize but are unsure about. These are the words that are right at your frontier — they are words you are familiar with, and can make educated guesses about, as opposed to words you have never seen or for which you have no context.

Your score on our vocabulary test gauges where your frontier of knowledge lies. Your score is expressed as a percentile. That means we are comparing you with other people, and there are two qualifiers to your score. First, we are only comparing you to people your own age. The longer you have been alive, the more language we assume you have been exposed to, so we assume older people know more words overall. Second, you are only compared to people we have tested. That is a self-selected group, and the clients who come to us often have higher levels of education and advantages than the general population. So, compared to the total English-speaking population of North America, your score might well be higher than is represented here.

Whatever your score, there is always room for improvement. Gradually work to learn new words that are at or just beyond your frontier of knowledge. These are words you recognize, but are unsure of as to their precise meaning and usage. Because you have some familiarity with them, those words take less energy to master than do words you have never seen before.

What Now?

Antoine Savelli

330259-12

March 26, 2026

Congratulations, you've made the decision to invest in your future career satisfaction and success!

What we've given you

You have received objective data about your natural approach to work based on decades of research into careers and human potential. Self knowledge is the first and most important step in choosing a career, as you're more likely to be successful in areas that align with your skills and strengths. You may have found that some of the tasks you did came easily and others seemed difficult or frustrating. It may not have felt like it at the time, but what you've actually done in these hours of testing is try out multiple career paths. On the Ideaphoria test, did you find you had many more ideas than time to write them all down? Now you know a creative or communicative role might be right for you. Do you have high numerical abilities? There's a likelihood that you'll enjoy roles that let you handle data. Now that you have a snapshot of how your mind likes to work, use this information as a lens through which to evaluate future career opportunities and experiences. Keep in mind that there can be many ways to use your aptitudes.

What Now?

Antoine Savelli

330259-12

March 26, 2026

Your role

Your career or educational path should be a partnership between aptitudes and a variety of other factors, including interests, financial priorities, values, and more.

Think about your educational and work experiences, and consider your hobbies and interests. Are there any consistent or long-running themes there? What were your favorite classes in school? What type of podcasts, websites, or TV shows do you enjoy the most? If you could sign up for any class, what would it be? Try to identify ways in which you have found satisfaction and success in using your natural abilities.

Compare aptitudes and interests

Compose two lists of potential careers — one based on your aptitudes and one based on your interests (you might also use the results of the Self Directed Search interest inventory for this exercise). Look for any overlap between the two lists. If a job appears on both lists, that's a promising sign that it's worth further investigation.

However, always keep in mind that interests can change. You can explore options that fit your aptitudes, even if they don't align with your current interests. You might discover new areas of interest that way!

What Now?

Antoine Savelli

330259-12

March 26, 2026

Other factors

Other than aptitudes and interests, other factors can contribute to your overall career satisfaction. Ask yourself questions like these:

- Do I want to work for a small company or a large corporation?
- Would I rather have set or flexible work hours?
- Do I want to live in a city, suburb, or rural area?
- Do I want to work from home, or have an office to go to everyday?
- What impact do I want my career to have on society?
- Do I need a stable salary or can I work on commission or contract?
- What other forms of compensation do I need (health insurance, retirement, vacation time, etc.)?

Research

Whether you're ready to make a drastic career change or are planning a more gradual transition, equip yourself to do something new:

- Explore new fields firsthand with informational interviews, job shadowing, or volunteering.
- Connect with people online through career-focused social networking sites. Try to identify people whose careers you admire and model your path after theirs.
- Research positions and roles available in companies you'd love to work for.
- If applicable, take advantage of career and networking resources through your alumni association.
- Attend industry-specific meet-ups and events.

What Now?

Antoine Savelli

330259-12

March 26, 2026

- Let your friends know you're looking for a new career. You may be surprised at the opportunities they are aware of.
- Develop new skills. Especially if you are trying to move into a new field, additional training might be necessary. Explore degree and certification programs designed for adults returning to school; consider online degrees, courses, and certifications.

Even if you are not in a position to make a major career change, you may be able to fine-tune your current position to bring it into closer alignment with your aptitudes.

- Start a freelancing career or side career.
- Look for opportunities to tweak your role to better fit your aptitudes. Can you delegate some job tasks and add others? Can you change the types of clients or customers you work with?
- Talk to your supervisor. Are there professional development opportunities available to you? Can you transition into a different department within your company?

Make a plan

Use the information you have gained through your research to make a plan for your professional life. Write down short- and long-term goals and develop a step by step plan to achieve those goals. Check in with your plan frequently to make sure you are staying on track.

Keep in Touch

You are now an alumnus of the Johnson O'Connor Research Foundation aptitude testing program. Although the testing portion is finished, we want you to get the most out of the information you received here, and we have resources to support you.

FREE FOLLOW UP

The summary appointment is meant to introduce you to your aptitude test results, but there is a second, optional counseling appointment, called a follow-up, also at your disposal. Your free follow-up can be taken any time and at any of our locations within one year of your summary appointment. This appointment gives you a chance to digest the information you received and talk in more detail about your aptitudes and plans. After the first year, there is a fee for follow-up appointments, but the chance to talk about your scores will always be available to you.

FREE VOCABULARY TEST

If you weren't happy with your vocabulary score, you're always welcome to come back in and retest. This can be combined with a follow-up visit.

SURVEY

Keep an eye out for surveys from us. We often email surveys as part of our research and to assess client satisfaction. Please let us know what you think! Any feedback we get enables us to improve our service.

SOCIAL MEDIA

You can find us on Facebook, Twitter, Instagram and LinkedIn. We use our accounts to share research and Foundation updates and articles that pertain to careers and aptitudes.

RATE US

We're often described as a best kept secret. We rely on word-of-mouth referrals, so if you enjoyed our service, please spread the word — in person and on social media platforms.

Our Tests

March 26, 2026

Analytical Reasoning

You placed chips with words on them onto a flow chart. This is a measure of your ability to organize and classify information, and to understand complicated systems.

Color Discrimination

You lined up color caps which vary by hue to form a color spectrum. This tests your ability to make fine distinctions between colors.

Color Vision

This is the standard screening test for red-green color deficiency.

Finger Dexterity

You moved pins three at a time from a tray into rows of small holes. This measures your ability to manipulate small objects with your fingers quickly and accurately.

Foresight

You were shown simple images and asked to write down possibilities for what the image could represent. Knowing your score can help you to determine the best approach to setting and achieving goals.

Graphoria

You were asked to compare sets of two numbers and indicate when the numbers were the same. This tests your clerical speed and accuracy.

Grip

Your grip strength was measured with a dynamometer. This indicates the extent to which you may need physical activity in your work.

Ideaphoria

You wrote as much as you could on an assigned topic within a certain time frame. This is a measure of the rate of flow of your ideas.

Our Tests

March 26, 2026

Inductive Reasoning

You were asked to look at rows of six pictures and select the three that had something in common. This indicates how quickly you can draw conclusions based on given information, which is helpful in diagnosing a problem or formulating theories.

Memory for Design

You were shown a series of line drawings and asked to replicate them on a sheet of paper with dots as guides. This tests your ability to memorize and create two-dimensional designs.

Mental Rotations

You looked at a drawing of a three-dimensional figure and determined which two of four options were versions of the same figure that had been rotated. This is an assessment of your ability to visualize in three dimensions.

Number Facility

You placed chips with numbers on them into two equations. This assesses your ability to do mental arithmetic quickly.

Number Memory

You were asked to memorize eight six-digit numbers. This measures your ability to recall numerical information.

Numerical Reasoning

You were asked to find the pattern in a series of numbers and determine the next number generated by the pattern. This measures your ability to reason with numbers.

Observation

You were shown a series of pages with pictures of ordinary, familiar objects and asked to identify the change between one page and the next. This measures your ability to spot and remember small visual details.

March 26, 2026

Paper Folding

You showed where the holes would be on a piece of paper that was punched with a hole and unfolded. This assesses your ability to visualize in three dimensions.

Pitch Discrimination

Two tones were played, and you indicated whether the second of the two was higher or lower than the first. This measures your ability to distinguish fine differences in pitch.

Rhythm Memory

Two rhythm patterns were played, and you determined whether the second was the same or different from the first. This indicates your ability to memorize specific rhythms.

Silograms

You were asked to memorize pairs of English and nonsense words. This tests your ability to learn words easily.

Structural Visualization

This is a combination of your scores on the Wiggly Block and Paper Folding tests.

Tonal Memory

You listened to a sequence of notes played twice, and identified which note in the second sequence had changed. This measures the ability to remember sounds.

Tweezer Dexterity

You used tweezers to move pins from on one side of a board to another. This tests your ability to use small tools quickly and accurately.

Visual Designs I & II

You were asked to indicate your preference between a series of pairs of images, in order to determine if your preferences match those of professional artists and designers.

Our Tests

March 26, 2026

Vocabulary

You were given a word, and asked to choose the word closest in meaning from a list of five. This measures your current knowledge of English words.

Wiggly Block

You assembled a three dimensional puzzle. This is a measure of your ability to visualize in three dimensions.

Word Association (Personality)

You were asked to respond to a stimulus word with the first word that came into your mind. This suggests the style or approach to work you may find most effective.

Writing Speed

You were asked to write the same sentence over and over for a set period of time. We are giving this test to determine whether a slow writing speed might affect performance on our Ideaphoria test.
